

Junicode

the font for medievalists

Entering characters with tags

for version 2

Entering characters with tags

Any character in Junicode that can be rendered using a Character Variant (cvNN) feature can also be rendered using a sequence consisting of a base character and two Unicode tags—that is, characters from the Unicode tag range. This range duplicates the ASCII character set (which consists, roughly, of things that can be typed on a U.S. English keyboard), but the characters it contains are normally invisible. They are used as modifiers for a preceding character (in other fonts, usually a flag symbol). Junicode contains a partial collection of tag characters:

 U+E0061	 U+E0062	 U+E0063
 U+E0064	 U+E0065	 U+E0066
 U+E0067	 U+E0068	 U+E0069
 U+E006A	 U+E006B	 U+E006C
 U+E006D	 U+E006E	 U+E006F
 U+E0070	 U+E0071	 U+E0072
 U+E0073	 U+E0074	 U+E0075
 U+E0076	 U+E0077	 U+E0078
 U+E0079	 U+E007A	 U+E0030
 U+E0031	 U+E0032	 U+E0033
 U+E0034	 U+E0035	 U+E0036
 U+E0037	 U+E0038	 U+E0039

When creating web pages or XML documents, you can enter these using character entities (e.g. `󠁳` for ); along the same lines, you can use the `\char` command (e.g. `\char"0E0073`) when composing TeX documents. But such entities and commands are not generally available in editors and word processors, and entering the tags themselves can be tricky because they are not only invisible, but also ignored

2 ENTERING CHARACTERS WITH TAGS

by the application (the cursor skips over them). Instead of attempting to enter the code points for tags directly, use character entities consisting of **an ampersand, two underscores, the tag character, and a semicolon**. These will yield visible tags. For example, typing `&__6;` will yield the tag .

To use the tag method of entering characters, first type the base character from the table below, then the two tags. For example, to make a square C () , enter one of these sequences:

Web page:	C󠁳󠁱
TeX:	C\char"0E0073\char"0E0071
Word processor:	C&__s;&__q; (appears as C  )

Then apply the OpenType feature ss10 (Stylistic Set 10) to the passage or passages containing the tags or, if tags occur throughout, to the whole document. The tags will disappear and the preceding characters (the base characters) will be transformed.

For variants of the combining macron (U+0304) and perhaps other combining marks, it will often be necessary to place the COMBINING GRAPHEME JOINER (U+034F) between the macron and the base character that precedes it. This will prevent normalization (the shaping engine changing sequences of character + combining mark into precomposed characters), which interferes with the operation of tags.

Most of the two-tag sequences documented here are designed to be mnemonic. For example, the  sequence in the example above stands for “square.” However, two-tag sequences are not capable of describing characters in any detail, and in some cases, where the number of variants is large (especially for period, combining macron, and currency), the tags are not descriptive at all, but rather an index (the same numbers used in the corresponding cvNN features).

These tags are compatible with Junicode’s other OpenType features, including the cvNN features, and can be mixed with them. They will not interfere with the placement of combining marks. Use a cvNN feature when a variant should appear throughout the text, in a particular passage (for example, a block quotation), or in a style. A tag sequence may be preferable for isolated forms or to override an OpenType feature.

In the list below, records for each character are color-coded as follows:

green	MUFI characters with PUA code points
yellow	Other characters with PUA code points
blue	Characters with Unicode code points
red	Characters without code points

Tags or cvNN features are usually to be preferred to PUA code points, which should be used only where accessibility and searchability are not issues (mainly in printed texts). Unicode code points can safely be entered directly. Junicode makes a few of them accessible via cvNN features and tags because it may often be desirable to associate these characters with their bases rather than the Unicode code points. For example, the insular T (ꝛ) is sure to be searchable as T if entered with the sequence $T \begin{smallmatrix} \boxed{1} \\ \text{TAG} \end{smallmatrix} \begin{smallmatrix} \boxed{0} \\ \text{TAG} \end{smallmatrix}$, but if entered as **U+A786** it may or may not be searchable as T, depending on the application.

Characters without code points can only be entered via tags or OpenType features.

Base	Sequence	Result	Description / Code point

¹Unicode entities (like &__a;) following U+A7C1 (Old Polish o) are not properly displayed or resolved for technical reasons related to U+A7C1 having very recently been added to Unicode. However, tags entered directly (as here) or via HTML/XML entity references and TeX commands will still work, and the Unicode entity will work once applications are updated with the latest additions to the Unicode standard.
